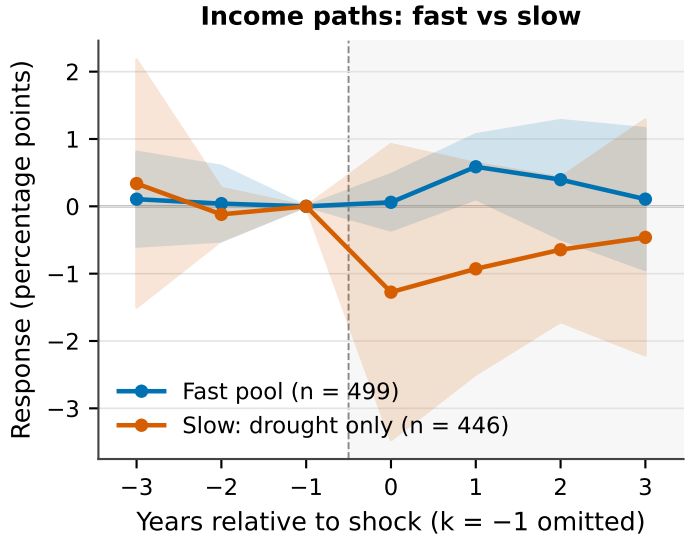
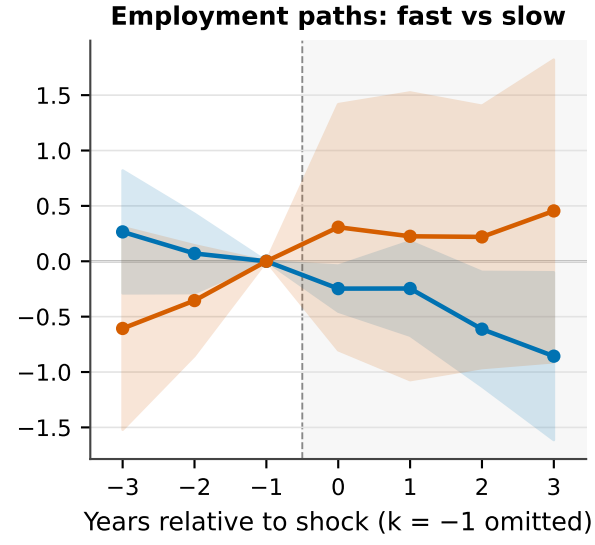
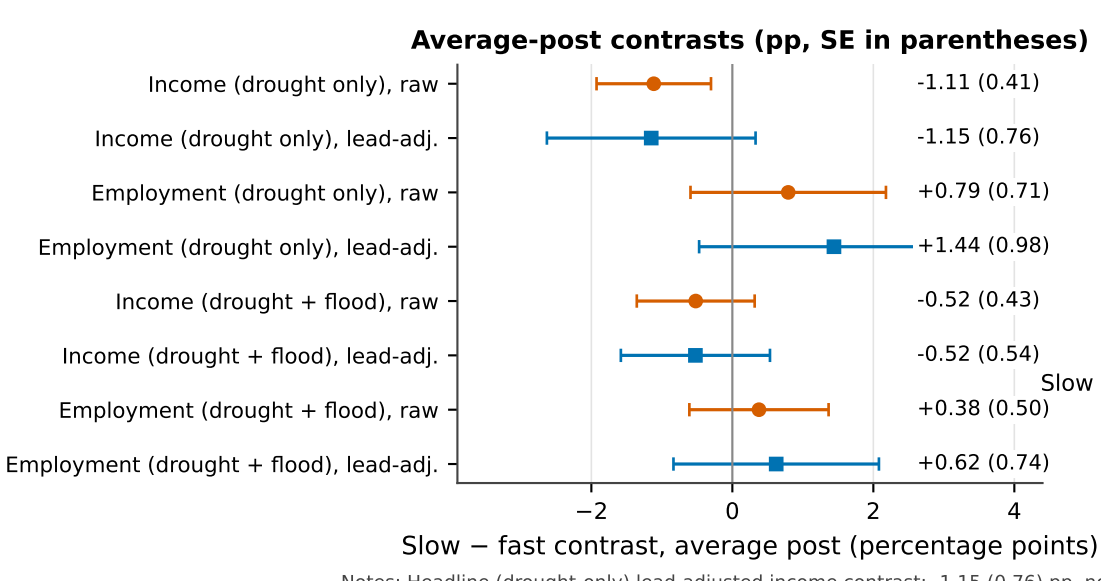
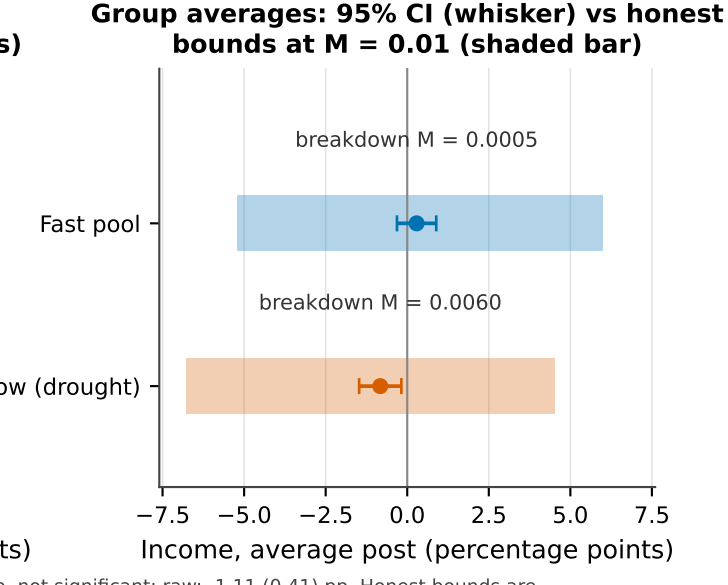
Figure 4. Onset contrast: slow-onset (drought) versus fast-onset shocks









Notes: Headline (drought-only) lead-adjusted income contrast: -1.15 (0.76) pp, not significant; raw: -1.11 (0.41) pp. Honest bounds are conservative smoothness bounds in the spirit of Rambachan–Roth; at M = 0.0025 the slow-group bound is infeasible (reported as such).
